

Broom Making Process

Author: Administrator User<wing@mosttrade.com>

Even though a machine is used in manufacturing brooms, the whole process is not completely automatic.

-- Wet the bundles of seedless tassels

-- Secure layers of broom straws around the handle

-- Clamp the crude broom in the machine to shape it and press tassels tight and steady until the

-- worker stitches individual pieces together.

-- Trim the ragged ends even to have a beautiful broom.

Little waste is produced during the whole making process. However, those short tassels needed removing away at once because they are flammable.
